Verónica Becher

A sequence is random for Turing machines if, essentially, its initial segments can only be described explicitely using a Turing machine.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

Verónica Becher

A sequence is random for Turing machines if, essentially, its initial segments can only be described explicitely using a Turing machine. That is, its initial segments cannot be compressed with a Turing machine.

Formally, a sequence is random if its initial segments have almost maximal descriptive complexity .

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

Descriptive / Kolmogorov / program-size complexity

Some long strings can be described using fewer symbols than their length; this is used in data compression .

input n; i=0; while (i<2ⁿ) {print a; i=i+1;}

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

Descriptive / Kolmogorov / program-size complexity

Definition (Chaitin 1975)

Fix a universal Turing machine U with prefix-free domain . The descriptive of a string $s,\ K(s),$ is the length of the shortest input in U that outputs s.

For every string s, $K(s) \leq |s| + 2\log|s| + constant$.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

The definition of randomness

Definition (Chaitin 1975)

A sequence $a_1 a_2 a_3 \dots$ is random if $\exists c \forall n \ K(a_1 a_2 \dots a_n) > n - c$.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

How do we know that the definition is right?

 $\mathbf{R} \ \mathbf{a} \ \mathbf{N} \ \mathcal{D} \ \mathbf{o} \ m \ \mathcal{N} \ \mathbf{E} \ s \ \mathbf{s}!$

How do we know that the definition is right?

The definition of randomness was accepted when two different formulations were shown to be equivalent.

This is similar to what happenned with the notion of algorithm in 1930s with Church-Turing thesis.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

An equivalent definition of randomness

Definition (Martin-Löf 1965, tests of non-randomness)

A sequence is Martin-Löf random if it passes all computably definable tests of non-randomness.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

An equivalent definition of randomness

Definition (Martin-Löf 1965, tests of non-randomness)

A sequence is Martin-Löf random if it passes all computably definable tests of non-randomness.

Technically, a sequence is Martin-Löf random if it belongs to no computably definable null set.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

An equivalent definition of randomness

Definition (Martin-Löf 1965, tests of non-randomness)

A sequence is Martin-Löf random if it passes all computably definable tests of non-randomness.

Technically, a sequence is Martin-Löf random if it belongs to no computably definable null set.

Theorem (Schnorr 1975)

Chaitin's and Martin-Löf's definitionare equivalent.

The Berry's paradox

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

The Berry's paradox

Give the smallest positive integer not definable in fewer than thirteen words.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

The Berry's paradox

Give the smallest positive integer not definable in fewer than thirteen words.

The above sentence has twelve.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

The Berry's paradox

Give the smallest positive integer not definable in fewer than thirteen words.

The above sentence has twelve.

G.G.Berry 1867–1928, librarian at Oxford's Bodleian library.

G.Boolos (1989) built on a formalized version of Berry's paradox to prove Gödel's Incompleteness Theorem formalizing the expression "m is the first number not definable in less than k symbols".

X.Caicedo (1993), La paradoja de Berry revisitada, o la indefinibilidad de la definibilidad y las limitaciones de los formalismos Lecturas Matemáticas 14: 37-48.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

Berry's paradox

Though the formal analogue does not lead to a logical contradiction, it yields a proof that descriptive complexity K is not computable.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

Are almost all sequences random?

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

Verónica Becher

Are almost all sequences random?

Yes. By Martin Löf's definition, the set of random sequences is the whole set minus the effectively defined universal null set. Then, with probability 1 an arbitrary sequence belongs to the set of random sequences.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

Verónica Becher

Is there a hierarchy of randomness?

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

Verónica Becher

Is there a hierarchy of randomness?

Yes. there is a hierarchy of automata. For example, incompressibility by Turing machines imples incompressibility by finite automata.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

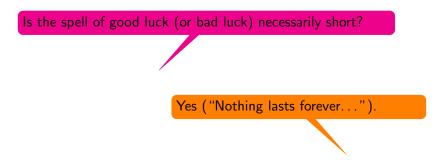

Verónica Becher

Questions and answers about random sequences

Is the spell of good luck (or bad luck) necessarily short?

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

Questions and answers about random sequences

Proof: Think of 0s and 1s. Suppose a random sequence starts $a_1a_2...a_n$. If there is a run of 0's longer than $\log n$, then $a_1a_2...a_n$ is compressible. Randomness ensures that this will happen only finitely many times.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

Can a computer output a random sequence?

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

Verónica Becher

Questions and answers about random sequences

Can a computer output a random sequence?

"Anyone who considers arithmetical methods of producing random digits is, of course, in a state of sin."

John Von Neumann (1951). Various techniques used in connection with random digits.

$\mathsf{R} \mathsf{a} \mathsf{N} \mathcal{D} \mathsf{o} m \mathcal{N} \mathsf{E} s \mathsf{s}!$

Questions and answers about random sequences

Can a computer output a random sequence?

"Anyone who considers arithmetical methods of producing random digits is, of course, in a state of sin."

John Von Neumann (1951). Various techniques used in connection with random digits.

Proof: Every computable sequences is dramatically compressible by a Turing machine! An initial segment of length n can be compressed to $2\log n$ +constant. Hence, computable sequences are not random. $\mathsf{R} \ \overline{\mathsf{a} \ \mathsf{N} \ \mathcal{D}} \ \mathsf{o} \ m \ \mathcal{N} \ \mathbb{E} \ S \ \mathsf{s}$

Randomness **V** Information

Randomness **V** Information

Definition (Shannon 1948)

Given a probability P of a discrete random variable X, the entropy $H(X) = \sum_{x} P(x = X)(-\log P(x = X))).$

Definition (Chaitin 1975)

Given a universal Turing U machine with prefix-free domain. $K(s) = \min\{|t| : U(t) = s\}, P(s) = \sum_{t:U(t)=s} 2^{-|t|}.$

Theorem (Chaitin 1975)

For every string s, $K(s) \simeq \lceil -\log P(s) \rceil$.

Shannon's entropy is formally equal to expected descriptive complexity:

$$\sum_{s} P(s)(-\log P(s)) \simeq \sum_{s} P(s)K(s).$$
